## Common Cognitive Biases: A Primer

CORD Academic Assembly 2020

| Cognitive <br> Bias | Description | Clinical Example |
| :---: | :--- | :--- |
| Availability <br> bias | The likelihood of an <br> event is judged based <br> on the ease of mental <br> retrieval. | Memory of your last patient with a headache who <br> ultimately had a diagnosis of subarachnoid hemorrhage <br> may prompt you to think of this diagnosis in your next <br> patient with headache. |
| Anchoring | Specific features of a a <br> patient's initial <br> presentation are <br> fixated or "anchored"" <br> on, with a failure to <br> adjust with new <br> information. | lt is influenza season in the ED and your patient tells you <br> that they have myalgias, sick contacts and did not get a <br> flu shot. You anchor to this feature of the history, failing <br> to adjust your impression upon hearing they have severe <br> headache and neck stiffness. |
| Diagnosis <br> momentum | A diagnosis is passed <br> on and becomes <br> established without <br> adequate evidence, <br> suppressing further <br> thinking. | A vomiting patient is labeled and passed on as having "a <br> GI bug" when care is signed out to you, preventing you <br> from considering and investigating alternatives such as <br> DKA or increased ICP. |
| Search <br> satisfying | The search is called <br> off once something <br> has been found. | A young adult is altered and smells of alcohol on a <br> Saturday night. Plan is made to let patient "sleep it off" <br> without considering co-ingestion. Many hours later, pt is <br> found to have increased anion gap and elevated ASA <br> level. |
| Ascertainment <br> bias | Thinking is shaped by <br> what one expects or <br> hopes to find. | If your patient has been previously identified to you as a <br> "difficult" or "frequent visitor" to the emergency room, <br> you may be more dismissive of their complaints. |

## Twelve Tips

## - Recognize heuristics

- Use "diagnostic timeouts"
- Worst Case Scenario, Most Common Scenario
- Ask Why
- Thorough history and physical exam
- Use a systematic approach to common problems
- Consider Bayesian theory or the use of base rates
- Acknowledge how the patient makes you feel
- Ask: "What doesn't fit? What can't we explain?"
- Know when to Slow Down
- Admit one's own mistakes: reflect and discuss
